

# The D. Coding Task

Write a web application that connects to Flickr (<https://www.flickr.com/services/api/>).

The Flickr API endpoints returns JSON payload. Use the system to

- Login with Flickr
- Have dashboard with the user “comments” and “photos”
- Apply CRUD method on
  - Galleries
  - Photos
- Get all the photos tags
- Search for users

The application should have a good UX & UI design.

## Things to consider

- Use Bootstrap framework
- Use AngularJS or VueJS
- All requests must be consumed using JSON format
- Use SasS or Less
- This task will be graded mainly based on how you architect the app and how the different layers of the code (views, models, API wrapper and controllers etc...) and the way they interact together, so pay close attention to that.
- Do not use pre-made templates, you must write your own, pay close attention to that.
- Use Github or Bitbucket for version control and sharing your code
